- 1) LiftNShift — Full-Stack Home Relocation Platform | Personal Project GitHub | Live Demo Java · Spring Boot · React 18 · MySQL · Redis · Kafka · Razorpay · JWT · Gemini AI · OpenRouteService • Architected an event-driven post-payment flow using Kafka (3 consumers), decoupling booking confirmation from downstream tasks and integrating Gemini AI for truck recommendations. • Built full-stack relocation platform with GPS-based dynamic pricing, slot booking, and JWT auth (User/Admin); integrated Razorpay with HMAC-SHA256 verification. • Eliminated N+1 queries (51→1 call/request), cut DB load ~60% via Redis caching, and prevented race conditions in slot booking with DB-level constraints + @Retryable.

Github: - <https://github.com/Shreyashkolhe22/liftNshift>

- 2) Swypee — Full-Stack Pet-Social Platform | Personal Project React Native/Expo · MongoDB · Redis · Socket.IO · Docker · Google Cloud · Gemini API • Diagnosed and resolved a production data-loss bug in a multi-threaded, concurrent write path — traced vanishing uploads to a non-atomic MongoDB read-modify-write race under parallel requests, replacing it with atomic operations to eliminate the defect class. • Root-caused a native Android OAuth failure to a signing-certificate SHA-1 mismatch via certificate cross-referencing; refactored logic into a globally-scoped NestJS module, and owned the release pipeline via Cloud Build → Cloud Run CI/CD.
- 3) AI Voice Agent — Live in Production | Personal Project Live Demo Python · LangGraph · RAG · Deepgram STT · TTS · OpenAI API · Claude API · Node.js (NestJS) · WebSocket · PostgreSQL · Docker · AWS • Built and shipped an end-to-end AI voice agent to production; LangGraph orchestrates conversation state, tool use, and context across concurrent sessions. • RAG pipeline grounded strictly in verified domain data to meet real accuracy constraints, with real-time STT/TTS over WebSocket. • Implemented RBAC, full audit logging, prompt guardrails, and a red-team eval pipeline — zero hallucination rate in production. • Built the eval harness from scratch: adversarial test cases, LLM-as-judge pipelines, and regression detection before every deployment.

4)FitFuel — Nutrition Tracking Web Application

- Developed a nutrition tracking web application using **Java, Spring Boot MVC, JSP, Hibernate, and MySQL**.
- Implemented food and nutrition management with **MVC architecture** and database persistence using JPA/Hibernate.
- Designed a responsive, user-friendly interface for tracking daily nutritional intake.

5)Kadak FM — Client-Side Audio Player

- Built a **single-page audio player** using **React, Vite, JavaScript, HTML, and CSS**, inspired by an Indian roadside chai tapri theme.
- Implemented **playlist management, track playback, custom cover art, responsive UI, and animated visual elements**.
- Designed the application as a **100% client-side static web app**, optimized for simple deployment on platforms like Vercel and Netlify.
